

## Cement's Toxic Legacy: ILLINOIS

### CONGRESSIONAL ATTACKS ON HEALTH PROTECTIONS

Cement manufacturers are dumping their pollution into Illinois communities with impunity. Lives are lost every year from this pollution, and our economy is forced to bear the burden of dollars spent on hospital visits, lost days at work, and sick Illinoisans who are breathing this toxic air pollution.

In August 2010, the U.S. Environmental Protection Agency at last adopted strong air pollution protections for more than 100 cement making facilities across the country, bringing pollution controls for this industry into compliance with Clean Air Act requirements that have been on the books since 1990. The protections make significant cuts in mercury, soot and other dangerous air toxics. The EPA estimates that the pollution cuts from these updates will prevent up to **2,500 premature deaths each year and yield up to \$18 billion in health benefits.**

But some members of Congress don't value saving lives and money and instead are carrying the demands of huge multinational cement companies that want to avoid cleaning up their toxic legacy. **H.J. Res. 9** would block the EPA's new requirement that these cement plants finally control their toxic air pollution with state-of-the-art pollution control technologies. A list of Illinois cement kilns and their emissions of toxic mercury pollution is below.<sup>1</sup>

Company	City	County	Kilns	Capacity (tons/yr)	Baseline Hg Emissions <sup>2</sup> (lbs/yr)
Buzzi Unicem	Oglesby <sup>3</sup>	La Salle	1/dry	567,000	51
St. Marys Cement	Dixon <sup>4</sup>	Lee	4/dry	636,000	78
Eagle Materials (Illinois Cement Co.)	La Salle	La Salle	1/dry	893,000	109
Lafarge N. America	Grand Chain <sup>5</sup>	Massac	2/dry	1,014,000	69

### THE DANGERS OF MERCURY

Mercury poisoning is a serious threat to our health. While adults can have severe reactions to mercury poisoning – typically brought about by consumption of fish tainted with

methylmercury, a highly toxic mercury compound – young children and unborn babies are especially at risk. This is why women are strongly cautioned to avoid consumption of many kinds of fish before, during, or right after pregnancy. Exposure to methylmercury while still young or in the womb can have an irreversible impact on a child's development, including birth defects, brain damage, reduced IQ, and difficulty with reading, writing, and learning.

The EPA estimates that **more than 300,000 babies are born every year with an increased risk of learning disability due to *in utero* exposure to methylmercury.**<sup>6</sup> Cement plants are among the worst mercury polluters. The EPA's recently finalized health protections will reduce cement plants' mercury emissions by more than 90 percent – in addition to dramatic cuts in other pollutants that impact our health such as lead, acid gases, and soot. We urge you to defend these health protections from efforts by your colleagues to block them from ever taking effect. Illinois moms are counting on it.

### FISH CONSUMPTION ADVISORIES

According to the 2009 Illinois Fish Advisory by the Illinois Department of Public Health, the Illinois Fish Contaminant Monitoring Program (IFCMP) has issued a statewide advisory to pregnant and nursing women, fetuses, women of childbearing age and children younger than 15 years of age for predator fish in all Illinois waters due to methylmercury. This includes all species of bass, sunfish, bluegill, crappie, salmon, walleye, sauger, saugeye, catfish, trout, gar, sturgeon, muskellunge and northern pike.<sup>7</sup>
